

Drone-based tracking of white sharks near the surf zone

Andrew Colefax

Paul Butcher, Brendan Kelaher, Dan Pagendam

How close is too close?

- Heightened sensitivity regarding sharks
- More search effort = more frequent evacuations
- When should a beach be evacuated?
- Public safety vs fear mongering

Drones are flying computers!

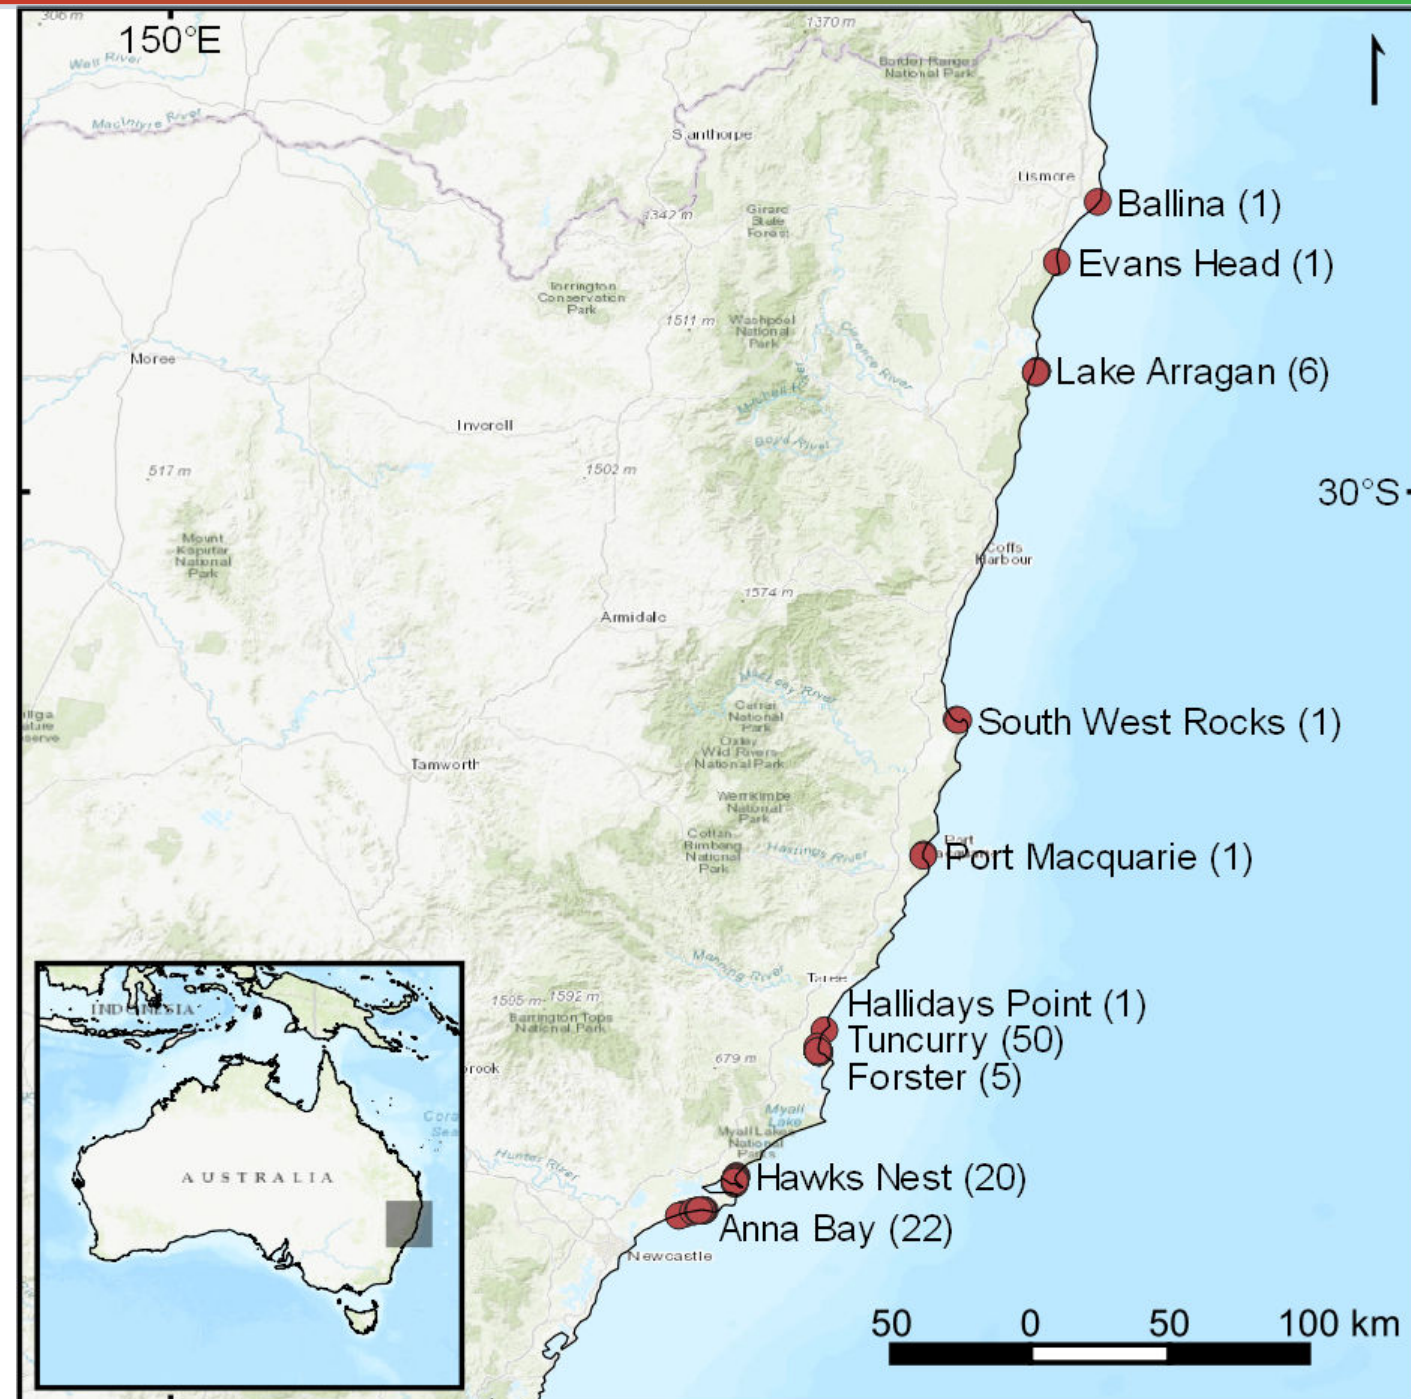

*“Let your smartphone fly with
Phone Drone”*

- GPS
- Barometer
- IMU & Gyro
- Speed controllers
- Extra stored information

108 white sharks tracked

- 26.33 hours of footage
- Mean track time: 16.9 min
- Max 102.7 min

- Behavioural observation

- Location at a given time

- Speed

- Weather variables

- Shark length

Swim speed: avg $0.82 \text{ m}\cdot\text{s}^{-1}$ (± 0.15)

- \uparrow Shark length (0.08 per m)
- \uparrow Schools of fish (0.33 max)
- \uparrow Other sharks and dolphins (0.08 max)

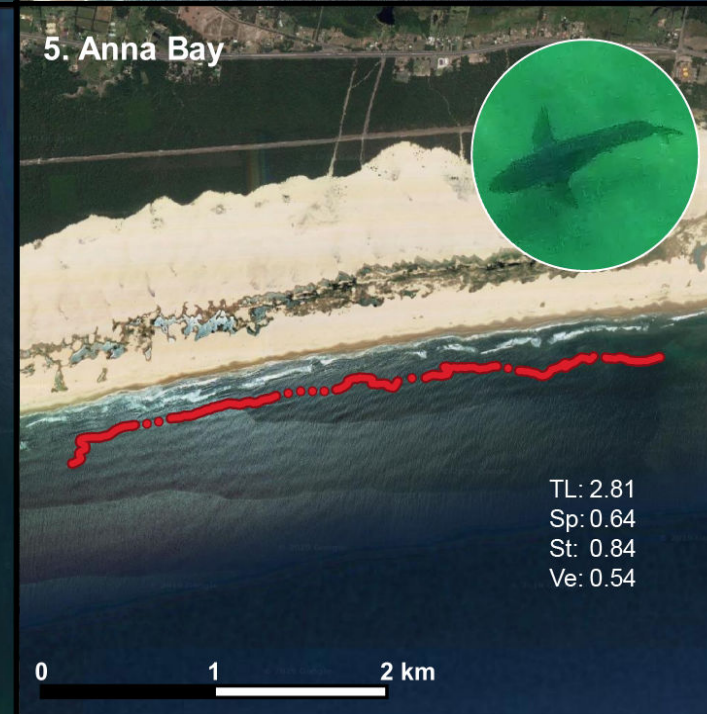

Straightness: avg $0.74 \text{ m}\cdot\text{s}^{-1}$ (± 0.24)

- \uparrow Shark length (0.12 per m)
- \downarrow Schools of fish (-0.34 max)

Velocity: avg $0.61 \text{ m}\cdot\text{s}^{-1}$ (± 0.23)

- \uparrow shark length (0.15 per m)

Conclusions:

- **White sharks move parallel to shoreline**
 - ... in a fairly straight line*
 - ... at slow speeds*
- **Energy conservation and opportunistic foraging, rather than actively patrolling for prey**
- **Helps determine when a shark may pose a threat – fewer beach evacuations.**

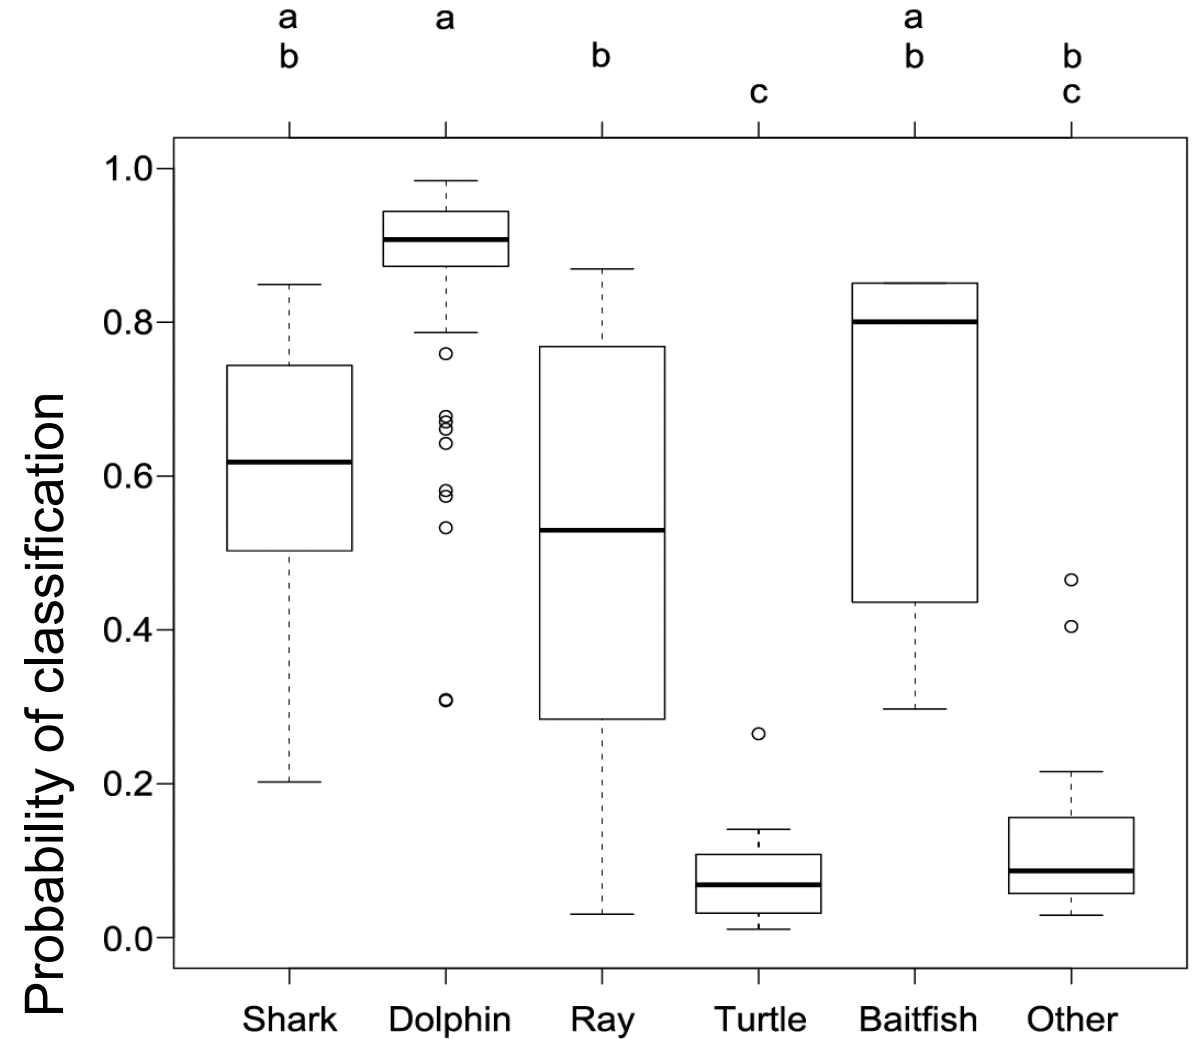

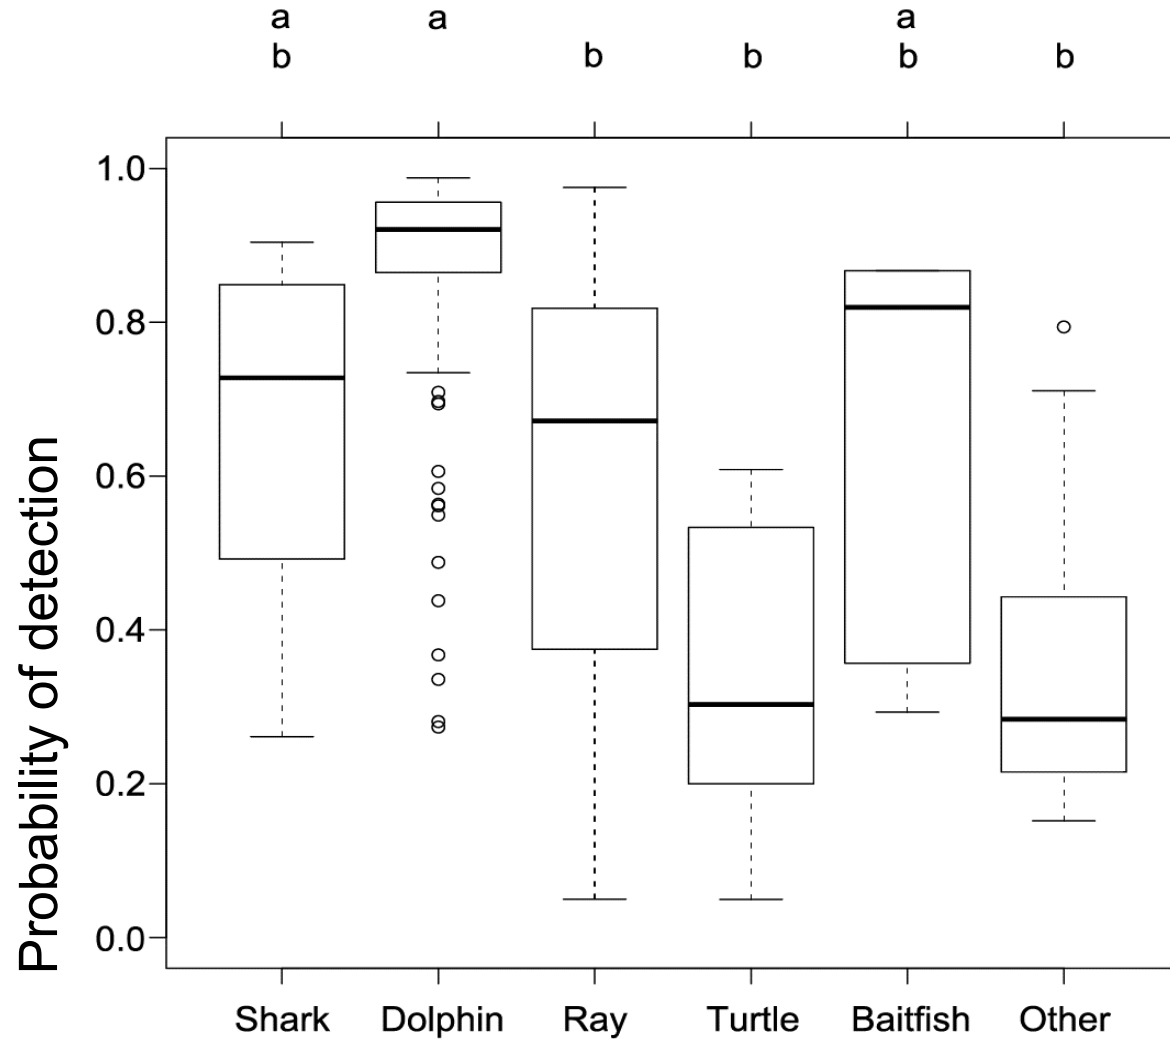

Making a recipe with hyperspectral to increase detection reliability
